

How to Care for a Snowmound Spirea Shrub

Spiraea nipponica 'Snowmound'

SELECT SITE:

Light Requirements: Full Sun (more than 6 hrs/day) or Part Sun (4-6 hrs/day)
This plant will grow larger, typically reaches 36" tall by 36" wide.
Grows in average, well drained soils; tolerates a wide range of soils.
Garden Uses: Shrub border, foundation, flowering hedge.
Ideal USDA Plant Hardiness Zones: 3,4,5,6,7,8

PLANT PREP:

Open box upon arrival, remove packing materials to let the plant "breathe". Remove plastic bag, tape, and newspaper. Water well. There are drainage holes in the bottom of the pot so do this outside where the extra water will drain away.

HOLE PREP:

Dig saucer shaped hole. The depth is determined by measuring the height of the roots from root flare to bottom. The width is 2-3 times the root ball diameter. Using these calculations, the ideal hole for the new plant will be approximately 18" tall by 18" wide.

PLANTING:

Put garden soil in a wheelbarrow or on a tarp. Mix the garden soil with equal amounts of mulch, peat moss, and potting soil. Place plant in hole and adjust for aesthetics. If desired, have someone hold it in place while more soil mixture is added, until the hole is completely filled. Push soil down until firm. Do not plant the plant deeper than it has already been growing. Water well immediately after planting. Mulch evenly to a depth of 2-3 inches.

FUTURE MAINTENANCE:

If desired, lightly shear plant after flowering ends to improve appearance. Flowers on new wood, so prune in late winter to early spring, if needed.

If desired, in Spring, apply 2 tbsp. of an all-purpose, slow release fertilizer upon the ground in a band around the plant at least 6" away from its stem.
