

# *How to Care for a* **Elijah Blue Fescue Grass**

## **Festuca glauca**

### **SELECT SITE:**

Light Requirements: Full Sun (more than 6 hrs/day).

This shrub will grow larger; space 9 in. away from other plants and/or structures.

Grows best in average, drier, well drained soils; intolerant of wet, poorly drained sites.

Garden Uses: Rock garden accent, in the border front, as a short edge along pathways, in mass as a cute ground cover.

Ideal USDA Plant Hardiness Zones: 4,5,6,7,8

### **PLANT PREP:**

Open box upon arrival, remove packing materials to let the plant “breathe”. Remove plastic bag, tape, and newspaper. Water well. There are drainage holes in the bottom of the pot so do this outside where the extra water will drain away.

### **HOLE PREP:**

Dig saucer shaped hole. The depth is determined by measuring the height of the roots from root flare to bottom. The width is 2-3 times the root ball diameter. Using these calculations, the ideal hole for the new bush will be approximately 10” tall by 24” wide.

### **PLANTING:**

Put garden soil in a wheelbarrow or on a tarp. Mix the garden soil with equal amounts of mulch, peat moss, and potting soil. Place plant in hole and adjust for aesthetics. Hold in place while adding more soil, until the hole is completely filled. Push soil down until firm. Do not plant the shrub deeper than it has already been growing. Water well immediately after planting. Mulch evenly to a depth of 2-3 inches being sure to stay at least 4” away from its trunk.

### **FUTURE MAINTENANCE:**

Cut back foliage in early spring to 3-4” to tidy clumps and to encourage new growth. If desired, fertilize in spring when new growth begins. Apply 2 tbsp. of an all-purpose slow release fertilizer upon the ground in a band around the plant at least 6” away from its stem.
